

TINAMU wins prestigious Commodities Technological Innovation Award

TINAMU, the pioneering ETH Zurich spin-off enabling drones to fly indoor autonomously, won the prestigious award as **Commodities Technological Innovator of the year 2024** by an independent jury across the global leading commodities hub in Geneva. The first Commodities Innovation Award organized by Bilan and Ampersand World brought together key players of the commodities sector to celebrate major innovators of the industry.

TINAMU offers **precise, automated, digital inventory data** at a push of a button enabled by drones flying indoor and outdoor autonomously without any need for a pilot. Based on computer vision, TINAMU enables drones to navigate in unknown territories without need of GPS and hereby offers a platform of flexible sensors allowing the recurring capture of new digital data and monitoring within dusty and rough industrial environments.

Today most stockpile inventories are done manually on paper, generating inaccuracy, errors, and safety risks. TINAMU allows cost, resource and carbon emission savings through better production and logistics planning based on up-to-date inventory data; digital, safe and automated. TINAMU helps to build **smart factories providing** supply chain, production and operations managers a **single source of truth**.

TINAMU Trust Through Technology.
